matlab% Transfer function of a DC motor
J = 0.01; % Moment of inertia
b = 0.1; % Viscous friction coefficient
K = 0.01; % Motor torque constant
R = 1; % Electric resistance
L = 0.5; % Electric inductance
P_motor = tf('s');
P_motor = K/((Js + b)(Ls + R) + K^2);
```

This representation enables subsequent analysis and controller design grounded in Ogata's modeling principles.

Analyzing System Response

Once modeled, engineers analyze transient and steady-state behavior:

- Time Response:** Using `step` and `impz` to observe system behavior.
- Frequency Response:** Using `bode` and `nyquist` plots to examine gain and phase margins.

Example:

```
matlabfigure; step(P_motor); title('DC Motor Step Response');
```

This visualization helps in understanding the system's stability and responsiveness, key considerations in Ogata's control design framework.

Designing Controllers

Based on analysis, controllers are designed to meet specified performance criteria such as stability, overshoot, and settling time.

PID Controller Design

```
matlabC = pid(1, 0.1, 0.01); % Proportional-Integral-Derivative controller
T_closed = feedback(C*P_motor, 1);
step(T_closed); title('Closed-Loop Response with PID Controller');
```

Root Locus Method

```
matlabrlocus(P_motor);
```

This graphical method illustrates how the poles of the closed-loop system move with controller gain adjustments, aligning with Ogata's root locus techniques.
